***Using Simulation To Determine
The Need For ICU Beds For Surgical Patients At
The Sir Mortimer B. Davis Jewish General Hospital***

Philip M. Troy, PhD

Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT

TEACHING HOSPITAL

Motivation For Study

- At the time, there were frequent cancellations of operative procedures requiring immediate ICU stays
- In particular, late in 2007 there was an extended period during which a very large number of cardiac surgeries needed to be postponed due to a lack of ICU beds
- As a result, Dr. Rosenberg wished to determine the number of beds that would be needed if there were a surgery only ICU

Literature Review On Surgery ICU Beds

- There are a number of papers discussing the issue of reserving ICU beds for surgical patients
- Some suggest limiting the daily number of surgeries requiring immediate ICU stays
- Others argue that any reservation of ICU beds for surgical patients will negatively impact care for medical patients
- This is a non-issue for very large hospital systems (such as the MAYO Clinic) that have sufficient demand to justify dedicated surgical and medical ICUs

HÔPITAL D'ENSEIGNEMENT | A MCGILL UNIVERSITY
DE L'UNIVERSITÉ MCGILL | TEACHING HOSPITAL

Actual Parameters Investigated

- Rather than just looking at the number of needed beds, instead looked at:
 - The total number of ICU beds (TOTAL)
 - The minimum level of occupied beds at which operative procedures that require an ICU stay, immediately after the procedure, are canceled (FUNCTIONAL)
- Wished to determine how the parameters individually and jointly would affect the shortage of ICU beds for surgical patients

Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT
DE L'UNIVERSITÉ MCGILL | A MCGILL UNIVERSITY
TEACHING HOSPITAL

Study Research Goals

- Build a tool that could be used to answer questions about the need for ICU beds for surgical patients
- Use tool to determine relationship between lack of availability of ICU beds for surgical patients, and TOTAL and FUNCTIONAL
- Use tool to identify potential avenues for further resolving bed shortage

TEACHING HOSPITAL

Our Approach

- Monte Carlo Simulation Study

- Statistical experiment using samples generated from pseudo-random numbers
- Using a discrete event model of ICU bed utilization
- Try to measure mean:
 - Wait time for operative procedures requiring an immediate ICU stay (wish to decrease)
 - Number of parked patients (wish to decrease)
 - Number of operative procedure cancellations due to lack of available ICU beds (wish to decrease)
 - Utilization of ICU beds (wish to increase)

Steps Of The Study

- Collect and characterize data
- Build simulation model
- Input data
- Test model
- Validate model
- Collect results
- Characterize results

Hôpital général juif
Jewish General Hospital

Philip M. Troy, PhD
Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT
DE L'UNIVERSITÉ MCGILL | A MCGILL UNIVERSITY
TEACHING HOSPITAL

Required Data

- Average inter-arrival time between operative procedure requests
- Probability of each operative procedure type
- Probability of each operative procedure type being an emergency
- Probability distribution of the time needed for each operative procedure type
- Probability of required ICU stay for each operative procedure type
- Probability distribution of the time between the end of the operative procedure, to when the ICU stay started, for each operative procedure type
- Probability distribution of ICU visit stay times, for each operative procedure type

Collected Data

- A list of all operative procedures performed by each service from April 2007 through March 2008 (from the hospital's surgical information system)
- For each type of procedure, a probability as to the fraction of the procedures of this type that required an ICU stay immediately after the procedure (provided by the chief anesthetist and an intensivist)
- A list of all ICU visits by surgical patients, the time at which their ICU stay started, and the length of their stay
- The operative procedure schedule for each service

DE L'UNIVERSITÉ MCGILL | TEACHING HOSPITAL

Approach Used To Estimate Probability Distributions

- Did not try to fit the data to particular probability distributions
 - There were too many distributions to fit
 - No reason to believe that the data fit particular distributions
- Instead, created empirical distributions
 - Possible issue for operative procedures with low frequencies
 - Since they had low frequencies, this seemed unlikely to significantly affect results

HÔPITAL D'ENSEIGNEMENT | A MCGILL UNIVERSITY
DE L'UNIVERSITÉ MCGILL | TEACHING HOSPITAL

Model Validation

- Compared, against expected values:
 - The number of queued up operative procedure requests at the end of the first three month warm-up period
 - The number of operative procedures performed per year
 - The number of queued up operative procedure requests at the end of the simulation run
- Presented the model to a committee of subject matter experts, a sitting hospital task force deliberating over how to address ICU bed shortages, to ensure that it met their criterion of reasonableness

The Monte Carlo Simulation Study

- For each level of FUNCTIONAL:
 - Performed 64 runs each using a different set of pseudo-random numbers
 - Computed average, standard deviation, and standard error of the mean for metrics
- When computing confidence intervals of metric means (in paper)
 - Since there was a total of 36 confidence intervals
 - Adjusted alpha of each confidence interval to $0.01 / 36$
 - To compensate for Bonferonni Inequality/Multiple Comparisons Problem
 - To obtain .99 probability that all confidence intervals contain their true mean

Results – Mean Wait (Days)

- For cardiac operative procedures requiring an immediate ICU stay (proxy)

<u>FUNCTIONAL</u>	<u>Mean Wait</u>
6	535
7	411
8	304
9	207
10	131
11	79
12	43
13	24
14	13
15	9
16	7
17	7

- Notes:

- Cardiac operative procedures needing an immediate ICU stay were used as a proxy
- For reasons discussed in paper, mean waiting times are actually larger than displayed for low levels of FUNCTIONAL
- Mean wait is strictly a function of FUNCTIONAL

Results – Mean Number Of Parked Patients

- Mean # of patients that should be in ICU that are parked elsewhere

–	<u>FUNCTIONAL</u>	<u>TOTAL</u>	<u>Mean</u>	<u>TOTAL</u>	<u>Mean</u>	<u>TOTAL</u>	<u>Mean</u>
	6	6	2.11	7	0.89	8	0.28
	7	7	1.91	8	0.75	9	0.23
	8	8	1.75	9	0.68	10	0.20
	9	9	1.44	10	0.50	11	0.13
	10	10	1.10	11	0.36	12	0.09
	11	11	0.83	12	0.25	13	0.06
	12	12	0.58	13	0.16	14	0.03
	13	13	0.34	14	0.10	15	0.02
	14	14	0.18	15	0.05	16	0.01
	15	15	0.10	16	0.03	17	0.01
	16	16	0.04	17	0.01	18	0.00
	17	17	0.02	18	0.00	19	0.00

- Notes:

- A mean of 1 implies that sum of hours all patients are parked is $24 * 365$
- This is a function of FUNCTIONAL and TOTAL, particularly for low levels of FUNCTIONAL

Results – Canceled Blocks

- Number of blocks of OR time in which at least 1 operative procedure was canceled due to a lack of available ICU beds

<u>FUNCTIONAL</u>	<u>Canceled Blocks</u>
6	473
7	404
8	336
9	262
10	195
11	136
12	88
13	50
14	24
15	12
16	5
17	2

- Notes:
 - This metric was used as a proxy for cancellations of operative procedures
 - It is strictly a function of FUNCTIONAL

Results – ICU Bed Utilization

- Mean utilization of all ICU beds

–	<u>FUNCTIONAL</u>	<u>TOTAL</u>	<u>Utilization</u>	<u>TOTAL</u>	<u>Utilization</u>	<u>TOTAL</u>	<u>Utilization</u>
	6	6	57.9%	7	67.1%	8	66.3%
	7	7	61.4%	8	68.1%	9	66.4%
	8	8	63.7%	9	68.5%	10	66.4%
	9	9	66.0%	10	68.8%	11	65.8%
	10	10	67.2%	11	67.9%	12	64.5%
	11	11	66.8%	12	66.0%	13	62.4%
	12	12	65.3%	13	63.5%	14	59.9%
	13	13	62.5%	14	59.8%	15	56.4%
	14	14	58.7%	15	55.7%	16	52.5%
	15	15	54.8%	16	51.8%	17	48.9%
	16	16	51.5%	17	48.6%	18	46.0%
	17	17	48.4%	18	45.8%	19	43.4%

- Mean utilization is a function of both TOTAL and FUNCTIONAL

Contributions

- In addition to a tool for analyzing ICU surgical bed needs, also developed:
 - Set of metrics to be measured
 - Understanding of many of the processes affecting surgery and ICU performance
 - Knowledge of data needed for simulating those processes
 - Ability to characterize that data so it can be used for such a simulation

Hôpital général juif
Jewish General Hospital

Philip M. Troy, PhD
Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT
DE L'UNIVERSITÉ MCGILL | A MCGILL UNIVERSITY
TEACHING HOSPITAL

Contributions

- The minimum level of occupied beds at which surgeries requiring immediate ICU stays are canceled (FUNCTIONAL) affects:
 - Average wait time for (cardiac) surgeries requiring an immediate ICU stay
 - Average number of parked patients
 - Average number of cancellations due to lack of available ICU beds
 - Average utilization of ICU beds
- The total number of ICU beds (TOTAL) affects:
 - Average number of parked patients
 - Average utilization of ICU beds

Study Observations

- For our hospital, beds in a surgical only ICU would not be consistently well utilized:
 - This in turn would exacerbate ICU nurse staffing challenges
 - This does not mean that there is no need to increase the total number of ICU beds

Hôpital général juif
Jewish General Hospital

Philip M. Troy, PhD
Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT | A MCGILL UNIVERSITY
DE L'UNIVERSITÉ MCGILL | TEACHING HOSPITAL

ICU Visit Observations

- While frequently very busy, there are periods of time in which there are available ICU beds
- Some of the patients in the ICU need respiratory care more than they need intensive care

Hôpital général juif
Jewish General Hospital

Philip M. Troy, PhD
Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT
DE L'UNIVERSITÉ MCGILL | A MCGILL UNIVERSITY
TEACHING HOSPITAL

Other observations

- The ICU is intimately linked to many other parts of the hospital
- Any analysis/optimization of the ICU needs to include:
 - Surgical scheduling
 - PACU
 - Ward
- There is currently a disconnect between surgery scheduling and (ICU and Ward) bed availability

Hôpital général juif
Jewish General Hospital

Philip M. Troy, PhD
Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT
DE L'UNIVERSITÉ MCGILL | A MCGILL UNIVERSITY
TEACHING HOSPITAL

Two Approaches To Bridging The Disconnect

- Static surgery schedule optimization
- Dynamic schedule optimization

Hôpital général juif
Jewish General Hospital

Philip M. Troy, PhD
Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT | A MCGILL UNIVERSITY
DE L'UNIVERSITÉ MCGILL | TEACHING HOSPITAL

Static surgery schedule optimization

- Pick a fixed schedule
- So that it minimizes bed issues
- When simulated a large number of times
- Two recent papers:
 - Martin Puterman at UBC
 -

Hôpital général juif
Jewish General Hospital

Philip M. Troy, PhD
Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT
DE L'UNIVERSITÉ MCGILL | A MCGILL UNIVERSITY
TEACHING HOSPITAL

Dynamic schedule optimization

- Delay surgery scheduling as long as possible
- Before finalizing the schedule simulate it a large number of times for several days
- Change the schedule if it results in (a significant number of) bed issues
- Two efforts:
 - Ours here at the JGH
 - University Of Michigan doctoral student

Hôpital général juif
Jewish General Hospital

Philip M. Troy, PhD
Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT | A MCGILL UNIVERSITY

Dynamic Surgery Scheduling – JGH Effort

- Java based simulation:
 - To obtain speed needed for optimization
 - To provide appropriate animation
 - To make it possible to embed it in other software

Hôpital général juif
Jewish General Hospital

Philip M. Troy, PhD
Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT
DE L'UNIVERSITÉ MCGILL | A MCGILL UNIVERSITY
TEACHING HOSPITAL

JGH Effort – Cont'd.

- The simulation will include the following:
 - Surgical processes (from initial surgeon visit through procedure)
 - Recovery in PACU, ODS and/or ICU
 - Recover in wards
 - Complications
- It will also include other ICU supply and demand issues including:
 - Availability of nurses
 - Demand for ICU beds from the E.D. and medical wards
 - Nurse/patient staffing ratios
- I am hoping that in the future it will include:
 - The E.D.
 - Other relevant areas of the hospital

JGH Efforts – ICU Data Requirements

- These efforts will require data from the ICU including:
 - Patient arrival information
 - Patient departure information
 - Other patient event information (as it affects nurse staffing)
 - Patient/nurse staffing information over time
 - Nurse vacation and sick leave data
 - Epidemic information
 - Patient diagnosis information
 - Some measure of patient status

Hôpital général juif
Jewish General Hospital

Philip M. Troy, PhD
Lawrence Rosenberg, MD, PhD

HÔPITAL D'ENSEIGNEMENT
DE L'UNIVERSITÉ MCGILL | A MCGILL UNIVERSITY
TEACHING HOSPITAL

JGH Efforts – Ultimate Goals

- Very significantly reduce operative procedure cancellations
- Smooth out demand for surgical ward, PACU, and ICU beds
- Reduce delays for surgical and intensive care
- Reduce hospital staff stress

Hôpital général juif
Jewish General Hospital
